2. Average return of the benchmark **

3. Standard deviation of change in unit value ***

* Past performance provides no guarantee of future performance.

** The average change in the unit value and in the value of the benchmark over the last three, five, ten years is calculated as the geometric average of the annual changes in the unit value and changes in the value of the benchmark.

*** Standard deviation is a statistical risk indicator that shows how strongly changes in the value of a unit fluctuate compared to their average change. The standard deviation of the change in the unit value over the last three, five, ten years and since inception is the annual standard deviation of the change in the unit value for the specified period.

Fund manager's commentary

Developed markets central banks either started or continued to cut interest rates which helped equities rise for the fourth quarter in a row. Equity markets displayed greater volatility due to sharp moves in the Japanese yen and some recession scares, however, the rally got broader – sectors such as utilities, real estate and industrials outperformed the previous leaders in technology and communications. Emerging markets had an impressive rally of 4,41% and outperformed developed markets after the news of the largest stimulus package in China since the covid-19 pandemic. Developed markets equities returned 2,14% in the quarter.

The shares and weightings of the fund's benchmark index are selected in accordance with the investment strategy set out in the rules of the fund, but the fund manager may make investment decisions at his own discretion. The value of the investment may fluctuate up and down. You may earn less than you have invested. Past performance is no guarantee of future results.
